## INTRODUCTION

This report is a photographic study of the electric power facilities, power grid, and other related hydraulic facilities of North Vietnam. It is not necessarily all inclusive, since it includes only installations identified on aerial photography. Periodic supplements to this publication will be disseminated as new facilities are identified or as better photography becomes available.

This report is divided into six sections:

SECTION A. Thermal Electric Powerplants--those facilities which produce power by utilizing steam-driven turbines.

SECTION B. Hydroelectric Powerplants--those facilities which produce power by utilizing water-driven turbines.

SECTION C. Diesel-Electric Powerplants--those facilities which produce power by utilizing internal combustion engines.

SECTION D. Power Grid System and Major Substations--the distribution system of 110 and 35-kv powerlines and their transforming and switching facilities.

SECTION E. Irrigation/Pumping Stations--hydraulic facilities, some of which bear a close resemblance to hydroelectric powerplants and require good quality photography to properly identify. This section contains a list of approximately 325 such facilities, a small percentage of which may later be identified as power producing facilities.

SECTION F. Miscellaneous--pertinent

items such as photographic examples of minor substations and transportable generators, and line drawings of typical powerline supporting structures.

Included within the first four sections are an introduction, table of contents, and a small scale locator map. A photographic analysis of the referenced photography, a large-scale plot map and a photograph are provided for each item in these sections. The irrigation/pumping stations are plotted on 1:250,000 scale maps with only representative photos included. The miscellaneous section contains a table of contents, selected photography and line drawings.

Installations which do not have a BE reference have been assigned a name utilizing the nearest town as shown on the appropriate map sheet of AMS Series L7014 (1:50,000). Geographic and UTM coordinates for all installations are also derived from Series L7014.

All installations reported are indexed by geographic coordinates in ascending order at the end of the report.

DIA Production Center has reviewed this product and has requested that readers be informed of its concurrence in the photo interpreters' conclusions presented.

**ADDENDUM**

Three powerplants listed in the Basic Encyclopedia (BE) have been analyzed by NPIC and negated as power producing facilities. The three are as follows:

Ta Sa Hydroelectric Powerplant, Na Ngan at 22-50-50N 106-08-01E [REDACTED] -- 25X1A  
this is an irrigation and flood control dam.

Ta Sa Hydroelectric Powerplant, Tinh Tuc at 22-39-01N 105-51-50E [REDACTED] -- 25X1A  
this is a flood control dam for the mining area. Two sedimentary dams are probably used to prevent silting and blocking of the flood control dam.

Thai Nguyen Thermal Electric Powerplant, Steel Plant at 21-33-19N 105-52-34E [REDACTED] 25X1A  
[REDACTED] -this is a streamplant serving the steel plant. Any existence of generators and other necessary electrical equipment, at this installation cannot be confirmed on photography.

25X1A

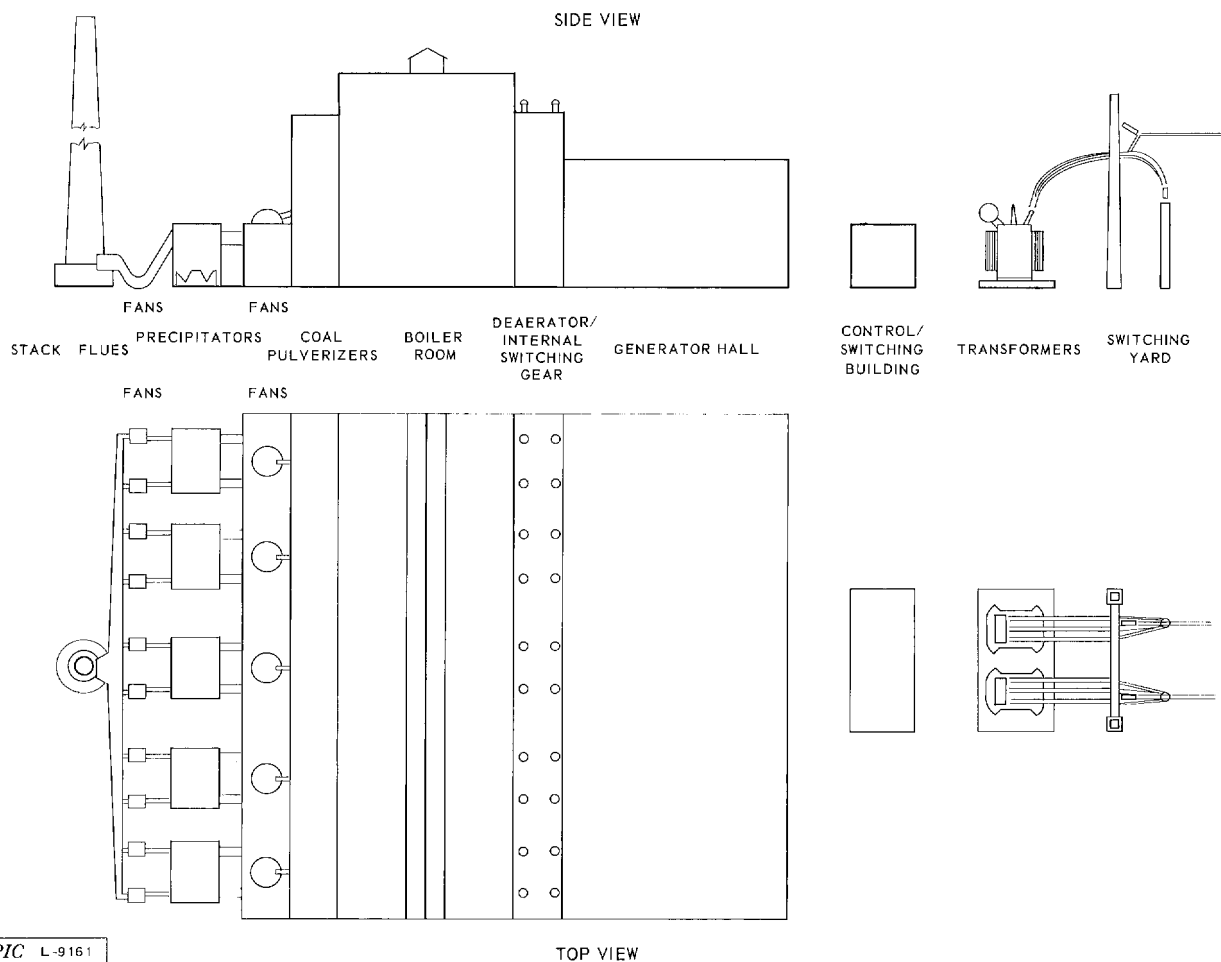

# SECTION A

## THERMAL ELECTRIC POWERPLANTS

## SECTION A Thermal Electric Powerplants

Most of the thermal electric powerplants in North Vietnam have been constructed with the technical and material aid of the USSR, China, Poland, and Hungary.

The basic components are a boilerhouse, a generator hall, a transforming facility, and an exhaust stack or flue. The primary fuel is coal with the most common layout being a basic stack-boiler-generator-transformer on-line design. An innovation to discharge exhaust gases has been observed at Uong Bi, Thanh Hoa, and Ben Thuy powerplants. This method simply extends the flues to one major underground flue, rather than a stock, which terminates in a vent some distance from the powerplant.

# **SECTION B**

## **HYDROELECTRIC POWERPLANTS**

**SECTION B**  
**Hydroelectric Powerplants**

Only three hydroelectric powerplants have been photographically identified in North Vietnam. One of these is still under construction and the other two are of low capacity, producing power only for local consumption. The powerplant under construction at Lang Chi is planned to have the highest hydroelectric capacity in North Vietnam, a reported 112,500 kw, and will be connected into the national electric power grid system.

The basic components of a hydroelectric powerplant are a forebay, a dam, a generator hall, a transforming facility, a spillway and a tail race.

Reportedly, the North Vietnamese are constructing a number of low head hydroelectric powerplants to diversify and improve their power capacity. In response to this information, 26 installations have been observed which present the same configuration as a low head powerplant.

## DIESEL - ELECTRIC POWERPLANTS

### SECTION C Diesel-Electric Powerplants

North Vietnam's diesel-electric powerplants (usually referred to as internal combustion powerplants) primarily produce power for immediate industrial areas.

The first type of installation identified consists of a single-story wood frame structure with an open or enclosed transforming/switching facility, and an exhaust stack that is generally, but not always, apparent.

This section contains only permanent-type installations, although the smaller transportable generators could be utilized to replace or supplement these installations. An example of a small, covered generator is included in the miscellaneous section.

R-146/67

## SECTION D Electric Power Grid and Substations

With extensive technical and material aid, North Vietnam has developed a sophisticated electric power grid (EPG) system.

The EPG comprises at least 483.6 km of 110-kv cable and at least 1,298.9 km of 35-kv cable. Specifically, there are 465.6 km of photographically confirmed 110-kv cable, 18 km of probable 110-kv cable, 1,031 km of photographically confirmed 35-kv cable, and 267.9 km of probable 35-kv cable.\*

Electric power substations which transform/switch either 110 or 35 kv are considered major substations and are included in this report. There are over 400 minor substations composed of either an open, semienclosed, or enclosed facility whose purpose is to transform/switch/distribute low voltage power for local consumption. These installations are not included, but a photograph of each type is included in the miscellaneous section.

As shown below, the basic components of a 35-kv substation are a control building, transformer(s), and a switching yard. The term "switching yard" refers to the switching gear on the power-line supporting structures within the substation area. In most cases the switching gear is assumed, since the switches can be observed only on low-level photography of good interpretability.

\*These totals include 57.2 km of double circuit 110-kv cable and 114.5 km of double circuit 35-kv cable.

## SECTION E Irrigation/Pumping Stations

This section contains a list of over 300 installations which are tentatively identified as irrigation/pumping stations.

Occasionally, as in the case of the Phu Xa Doai Irrigation Station on page E-32, photography reveals conduits on both sides of the main structure which marks the installation's function.

I/P stations are generally located on a canal or along a river bank and consist of a single-story wood frame or concrete structure (enclosing suction pumps) with 1 to 20 intake and discharge conduits. These stations have either a small step-down transformer and switching yard or are directly connected by powerlines to a power supply.

In this section each of the facilities is located on a 1:250,000 scale map and is referenced by UTM and geographic coordinates and province. Confirmed I/P stations are indicated by ● and unconfirmed installations are indicated by ▲. Photographic examples of both confirmed and unconfirmed installations are also included, beginning on page E-26.
